## Assignment 2. Regression

Semester 2, 2024

Due 5:00pm, Thursday 10<sup>th</sup> of October 2024

---

### 1. Introduction

The goal of assignment 2 is to help you understand regression. The task is to predict the sales price for each house by building an advanced regression model. You need to write Python code to predict the sales price.

The total score is 25 marks. You are required to submit:

- (1) the runnable codes (17 marks)
- (2) a report in PDF (8 marks) that includes the methodology, analysis and results.

Please submit a .zip file via MyUni.

### 2. Tasks

Your task is to build a regression model to predict the sales price for each house. The provided dataset includes 38 features of the houses and their corresponding house prices (Please refer to section 3 for a detailed description). You are free to choose the regression models.

Specifically, the tasks you need to complete are:

- (1) There are missing values in the provided dataset for both training and test set. Will the missing values affect the model training? How do you solve the issue? Do research on the possible solutions, choose two solutions and justify the reason you choose them. Write your own code to apply the two solutions and compare the regression model's performances on the datasets that apply the two solutions. Section 5 gives reference about handling missing values. (6 Marks)
- (2) Write Python code to build a regression model from the training set that you applied the better solution in (1). Write the code to evaluate its performance on the test set that you applied the better solution in (1) with Root-Mean-Squared-Error (RMSE). RMSE shares similar motivation of the least square loss we taught in the lecture. Section 5 gives reference for the definition. Please try at least two regression models and compare their performances. (6 Marks)

### 3. Data Description

**train.csv** - Has 40 columns, the first column is the house ID, and the following 38 columns are features. The labels are in the last column SalePrice. There are three features that have missing value problems: OverallQual, OverallCond, YearBuilt.

ID	MSSubClass	LotArea	.....	YrSold	SalePrice
1	60	8450	.....	2008	208500
2	20	9600	.....	2007	181500

**test.csv** - Has 40 columns, the format of test.csv is the same as train.csv.

**data\_description.txt** - Detailed description of each column.

### 4. Deliverables

(1) Runnable codes in Python. (task: 12 marks, instructions and comments: 5 marks, in total 17 marks)

The codes can be .py files or a jupyter notebook file with clear instructions including required packages, how to run the codes (if applicable). You need to write comments for your code for comprehension and also as the best practice. Required packages must be listed in the requirement.txt file.

(2) A report in PDF format (8 marks) should have the following sections

- A description of how to handle the missing values in your code and report the results. (2.5 Marks)
- A description of the regression technique you used. (3 Marks)
- A description of the results to report. (2.5 Marks)

Note: Please use visualizations (figures or tables) to report the results and provide descriptions of the results.

### 5. Useful Resources
